# Context: After-Sales service contracts for spare parts

“Performance-Based Contracting (...) tying a supplier’s compensation to the output value of the product generated by the customer (buyer).”

S.H. Kim, M.A. Cohen and S. Netessine (2007)

# Context: ASML and its customers

*After-sales service*

## High Tech Equipment

High number of low failure rate components coupled with high uptime service commitments:

- > 10,000 spare parts and service tools
- > 45 locations worldwide
- > 3,000 systems serviced

## Chip Manufacturing

High number of process steps for one layer, multiple layers and expensive capacity extension:

- High utilization, bottleneck machine
- 72,000€ per hour of downtime
- 27 days to recover from a 24 hours downtime

# Impact of extreme long downs on a modern fab

# Context: Existing service measures

Customer Service Degree

No commitment on late deliveries

DownTime Waiting for Parts

Multiple fast deliveries can compensate for a very long one

Current service measures, including their variants, do not directly cover the need to prevent (extreme) long interruptions though they hurt the customer the most.

# Focus on variability: next step for service

## XLD definition

Time-to-repair longer than H consecutive hours (e.g. 24hrs)

## Time-to-repair

Diagnostics, parts and tools delivery, swapping and recovery

## O'Connor and Kleyner, 2012

Spare parts supply is the main source of variation

## Our scope

Spare parts and service tools

# Agenda

# New service supply concept developed for ASML

## Research question

How to modify a service supply concept to reduce the number of extreme long downtime events (XLDs)?

- 1 Create a new service concept that reflects better customer impact resulting in more transparency and better alignment
- 2 Develop and implement a new spare parts and service tools planning approach to support the new service metric
- 3 Use the key insights of our research on XLDs

# High level plan

# Example: New critical material definition

# Agenda

- Context
- Journey
- Summary of the changes
- **New service concept**
- Results after implementation

# New service measure developed: Hit Ratio

Demand

All requested items delivered to fab

Miss

Requested item not available within the SKU-specific target shipment time

$$\text{Hit ratio} = \frac{\text{One month observed demand for all SKUs} - \text{One month missed deliveries}}{\text{One month observed demand for all SKUs}}$$

# Hit Ratio: Transparent delivery times per SKU

- Per site a stocking proposal is made based on new business rules
- Local (1) is further split in:
  - A. High usage materials
  - B. Dead-on-Arrival multi-hitter
  - C. XLD drivers

# Illustration of the new concept for a theoretical fab

**High level overview per bucket**

|             |                                                                                                                                        | Target shipment time | Performance Target |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------|

| 3           | <ul style="list-style-type: none"> <li>Extreme low request items</li> </ul>                                                            | 36 hrs               |                    |
| Emergencies | <ul style="list-style-type: none"> <li>All parts and tools not delivered as planned from bucket 1, 2 &amp; 3</li> </ul>                | 72 hrs               |                    |

# New service supply concept implemented at ASML

# Agenda

- Context
- Journey
- Summary of the changes
- New service concept
- Results after implementation

# Results measured over the worldwide installed base

The new service measure and planning approach have been implemented and resulted in:

- > 50% overall decrease of emergency shipments
- > 80% decrease in fast movers' emergency shipments
- ~ 5% cost increase

Helping chip manufacturers worldwide achieve more stable operations:

- ~ 20% reduction in long downtime events (XLDs)
- ~ 1.5B€ generated across the semiconductor industry
- Making the industry more sustainable

# Summary

We designed a new service concept to reduce the number of extreme long system interruptions – Hit Ratio

Our new service concept resulted in a new optimization problem for the tactical planning, new algorithms and new business rules

We implemented the new service concept to the complete service network of ASML and analyzed its impact – 1,5 B€ generated

**Thank you**
